

Convolutional Neural Networks (8DC00)

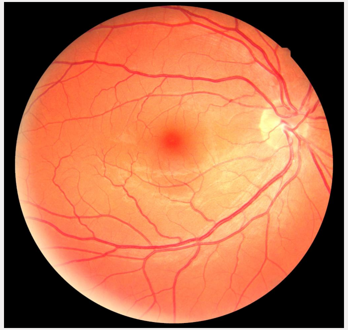
Friso G. Heslinga

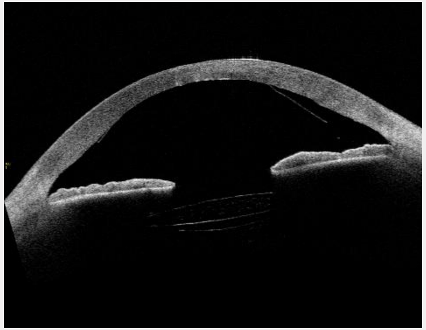
Friso G. Heslinga MSc.

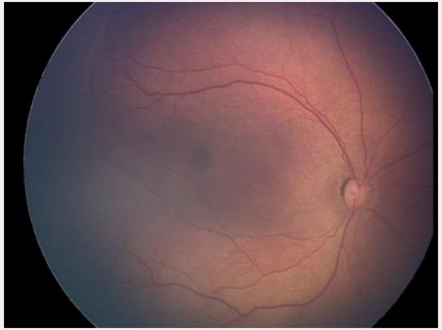
Background: BSc and MSc in Biomedical Engineering, MSc in Health Sciences (University of Twente).

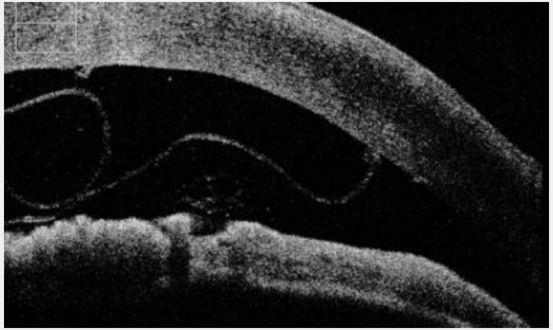
Work/internship experience: University of Western Australia, University of California - Berkeley, Harvard Medical School

PhD Research: Deep learning, Medical image analysis, Ophthalmology



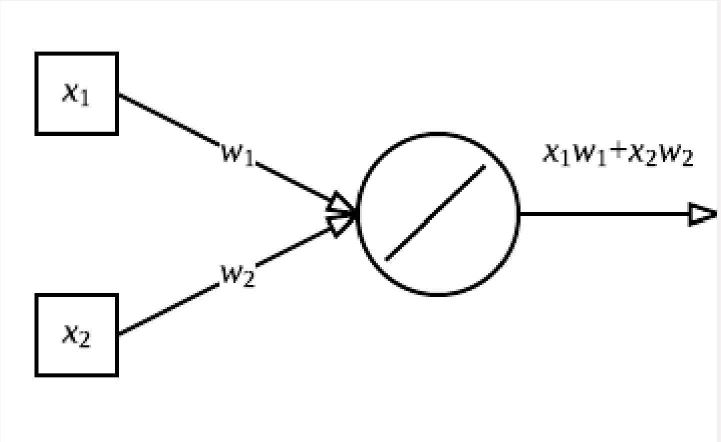




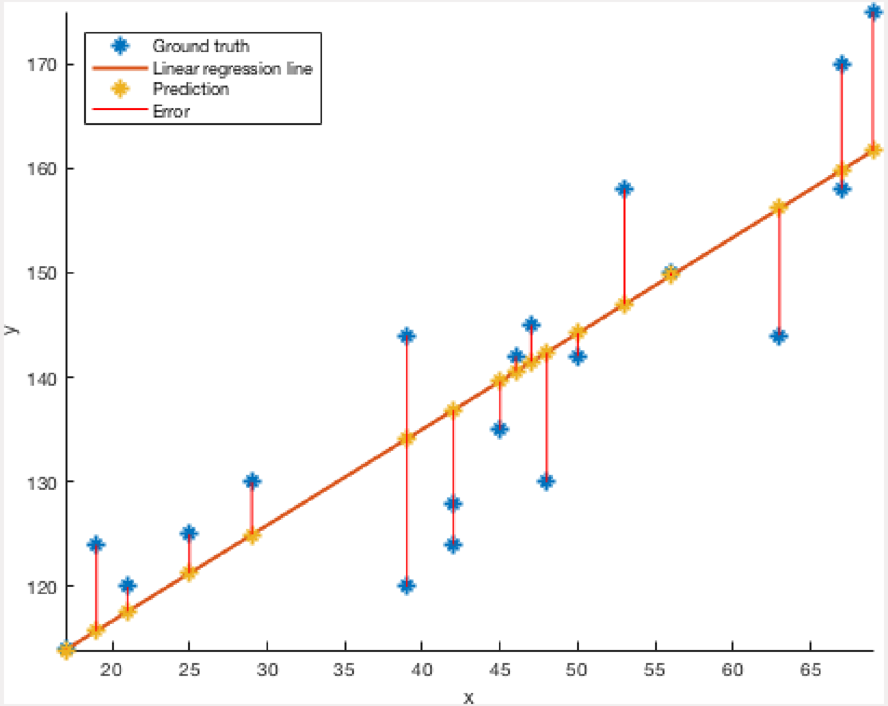


Week	Date	Lecturer	Topics
1	1 Sept.	Maureen	Course introduction; Software demo; Image registration (1)
	3 Sept.	Maureen	Image registration (2); Geometrical transformations
2	8 Sept.	Maureen	Point-based registration
	10 Sept.	Maureen	Intersity-based registration; Evaluation metrics
3	15 Sept.	*Catch-up day (no lecture)*	
	17 Sept.	Cornel Zachiu (UMCU)	Guest lecture 1: Image analysis for adaptive radiotherapy
4	22 Sept.	Mitko	Introduction to CAD; k-NN; Decision trees
	24 Sept.	Mitko	Generalization and overfitting
5	29 Sept.	Mitko	Logistic regression; Neural networks
	1 Oct.	Friso	Convolutional neural networks
6	6 Oct.	Friso	Deep learning frameworks and applications
	8 Oct.	Friso	Unsupervised machine learning
7	13 Oct.	Maureen	Deep learning for deformable image registration
	15 Oct.	Geert-Jan Rutten (ETZ)	Guest lecture 2: Image analysis in neurosurgery applications
8	20 Oct	*Self-study (no lecture)*	Active shape models
	22 Oct	*Self-study (no lecture)*	Active shape models

Previously – Linear regression

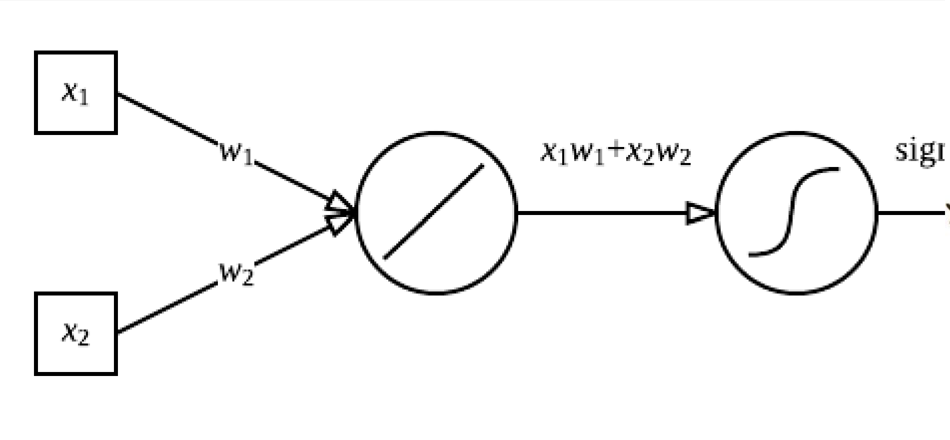


$$\hat{y} = \boldsymbol{\theta}^{\mathsf{T}}\mathbf{x}$$

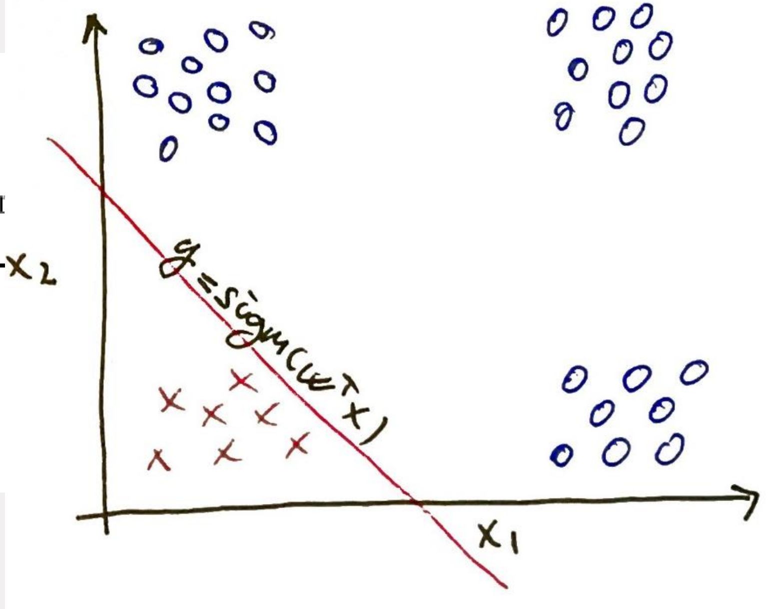


TU/e

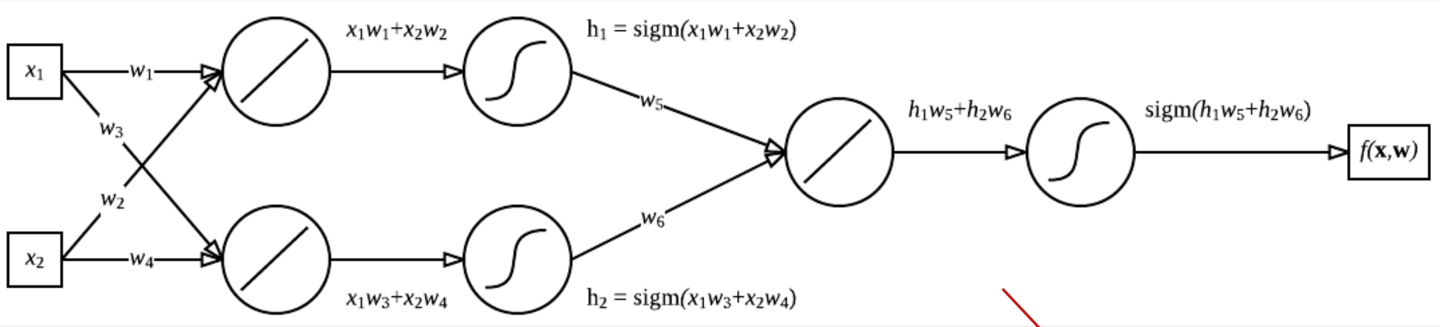
Previously – Logistic regression

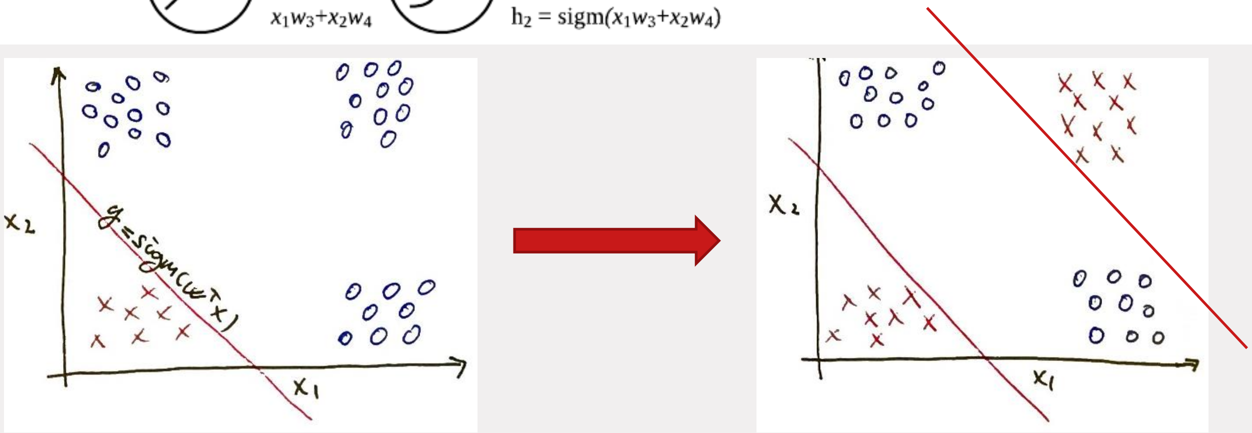


$$p(y = 1 \mid \mathbf{x}) = \sigma(\boldsymbol{\theta}^\top \mathbf{x})$$

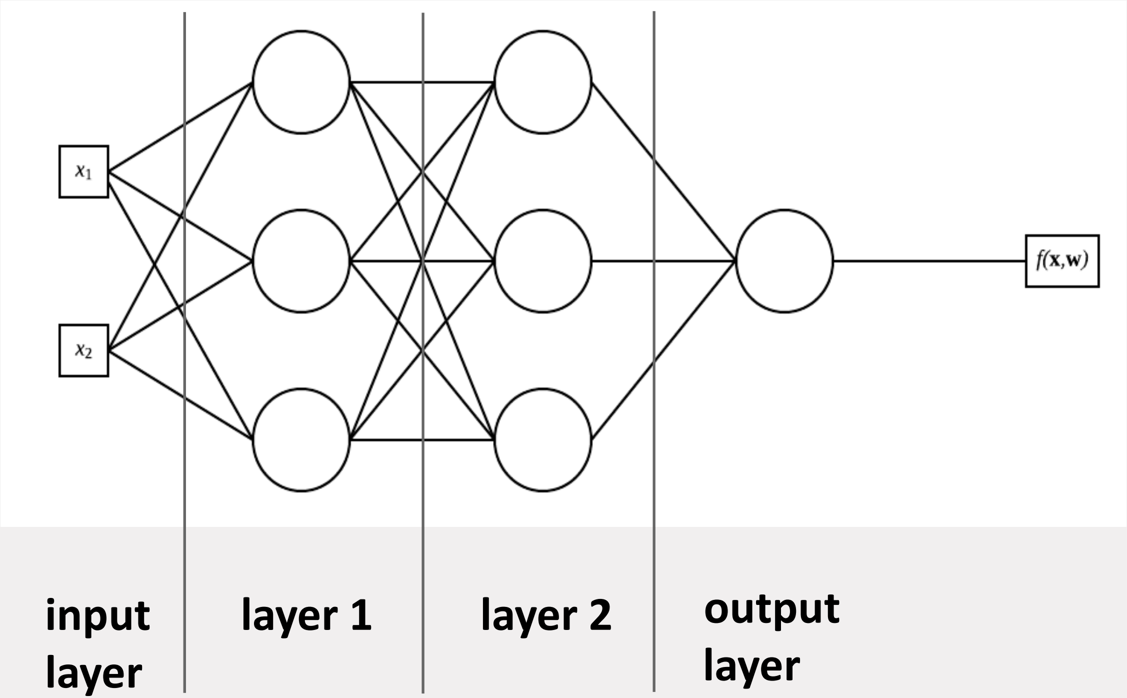


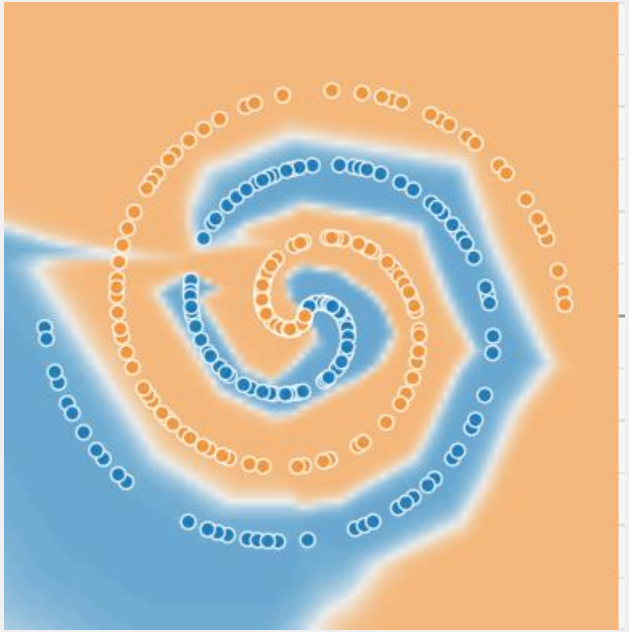
Previously – Neural networks





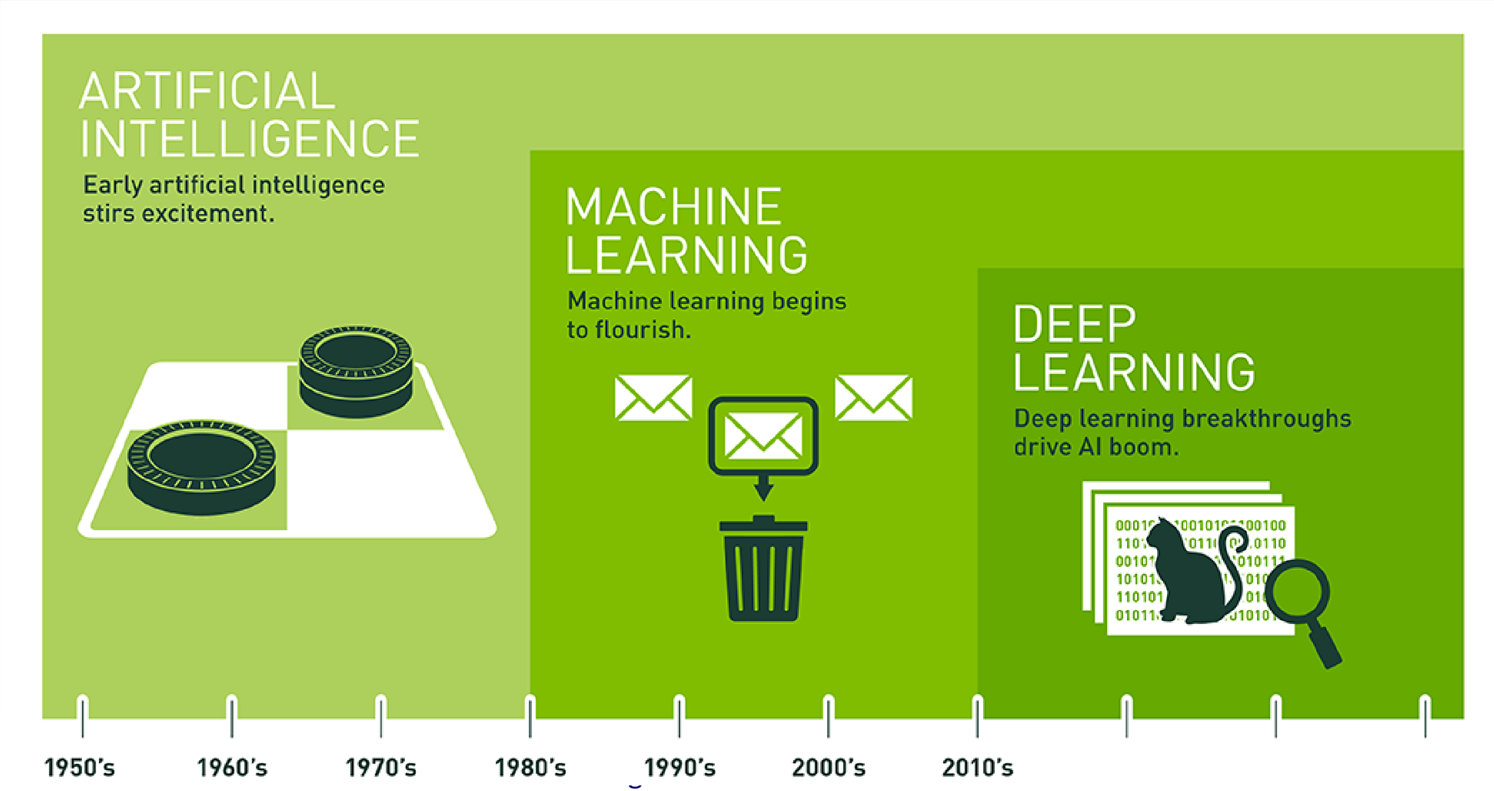
Previously – Neural networks





Previously – Machine learning

Figure source: nvidea.com



Today: Convolutional neural networks (CNN)

- Neural networks → Convolutional neural networks

Building blocks for deep learning models for image analysis:

- Convolutional layer
- Max-pooling layer

- Not needed for the project, but will be on the exam

Learning outcomes

- Student can explain the concept of **convolutions** in a neural network
- Student can describe why we can use a **convolutional approach** for (medical) **images**
- Student can explain why convolutions enable development of **deep** (and large) **neural networks**
- Students can explain and apply the **max-pooling layer** in a convolutional neural network
- Students can motivate the choice for a **kernel size**

Lecture outline

- Images as input to neural network
- Reducing # of weights
- 1D convolutions
- 2D convolutions
- *Break (15 mins)*
- Kernels
- Max-pooling
- Interactive example

Images as input to neural networks

24 pixels

24 pixels

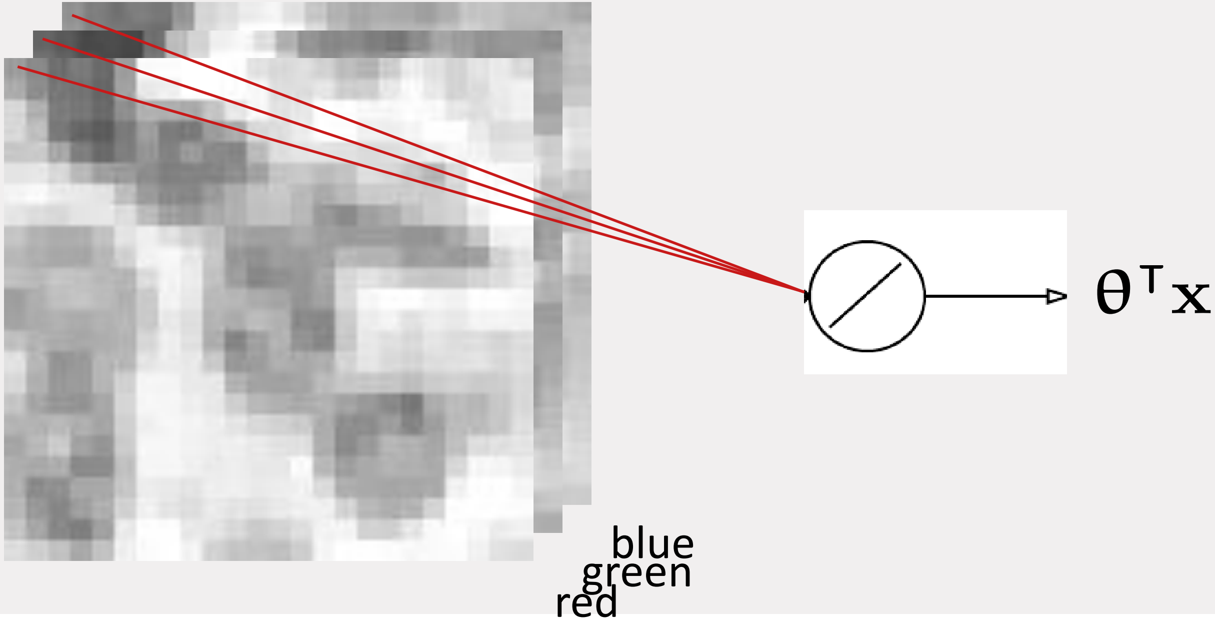
3 color channels
(red, green, blue)

= 1728 features ($\mathbf{x}_i$ are 1728 dimensional vectors)

If we train linear regression with these inputs (such as in the first practical), we will have 1728 weights w and a bias b.

Every pixel is an input

Every pixel from every color channel is multiplied by a weight



Post-training: visualizing what model has learned

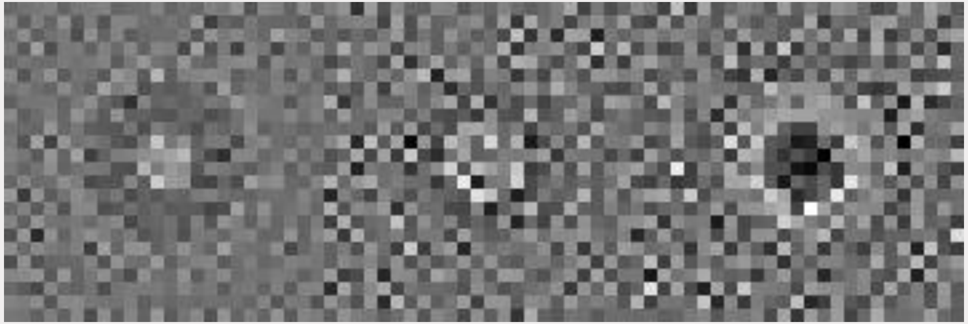
Reshape vector of parameters into 24x24x3 image

24 pixels

24 pixels

3 color channels
(red, green, blue)

24 pixels 24 pixels 24 pixels



Post-training: visualizing what model has learned

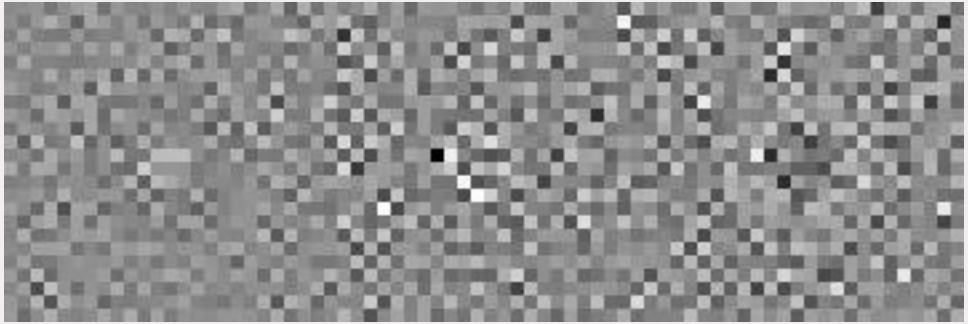
Only 25% of training samples.. Looks noisy!

24 pixels

24 pixels

3 color channels
(red, green, blue)

24 pixels 24 pixels 24 pixels



Post-training: visualizing what model has learned

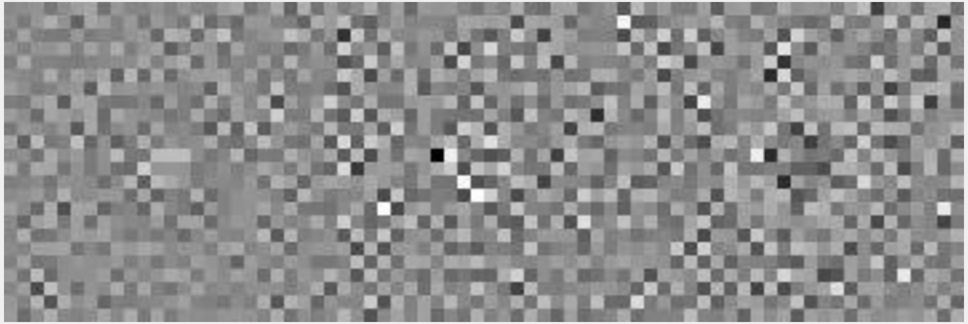
You can think of it as “there is not enough training data to reliably estimate all model weights”.

24 pixels

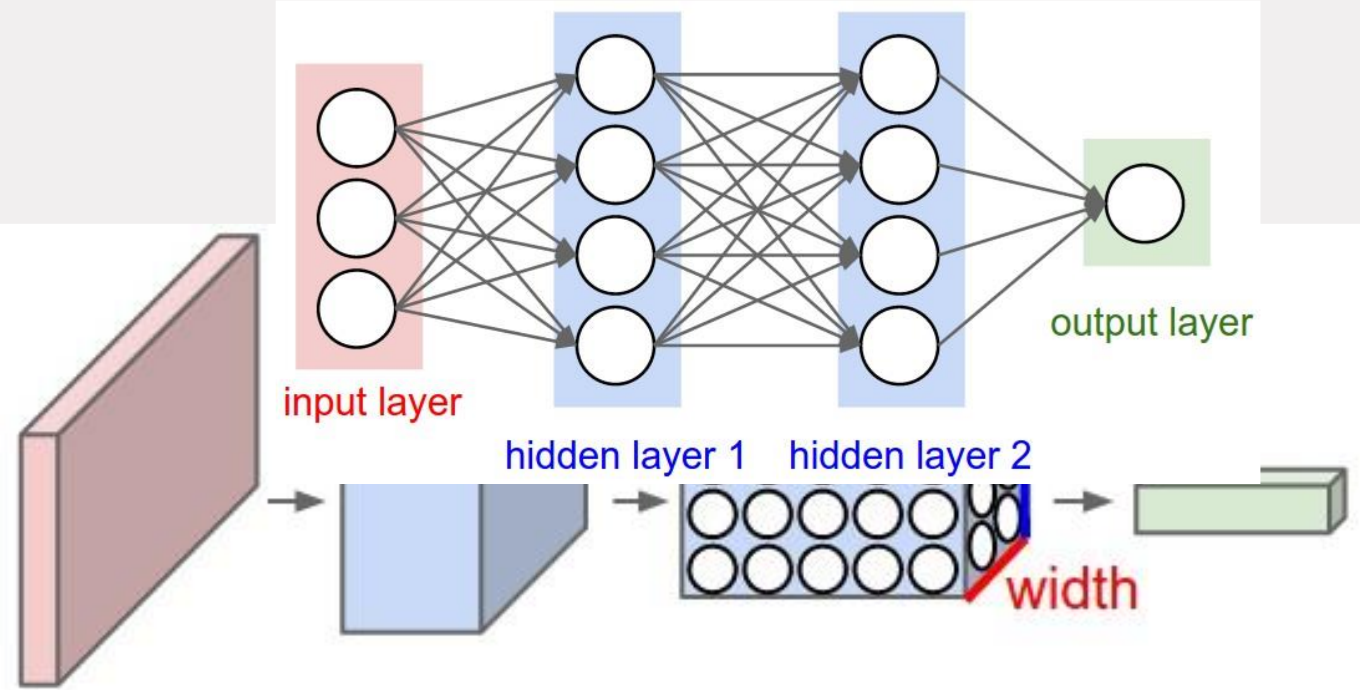
24 pixels

3 color channels
(red, green, blue)

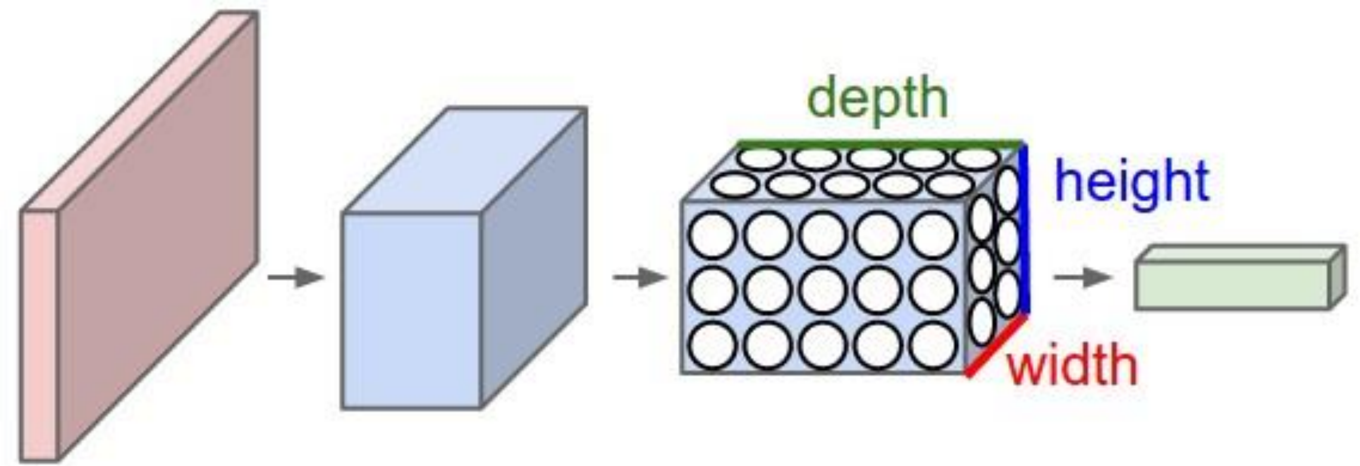
24 pixels 24 pixels 24 pixels



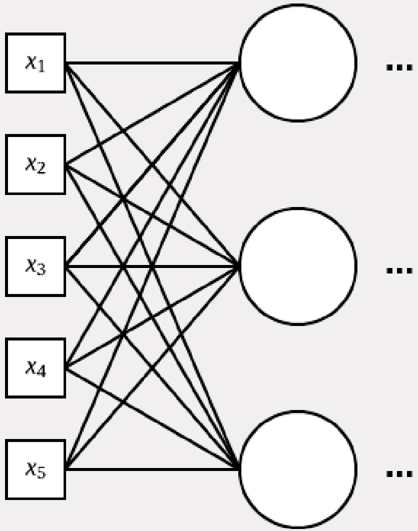
Many weights



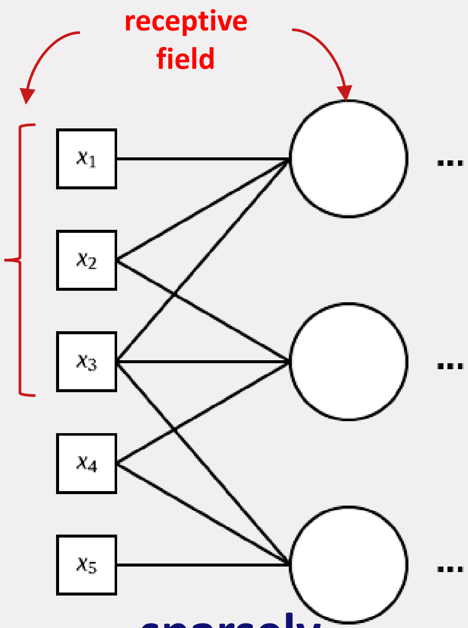
With large inputs such as images and deep networks, the number of weights ”explodes”. We need a way to reduce the number of weights, without sacrificing performance.



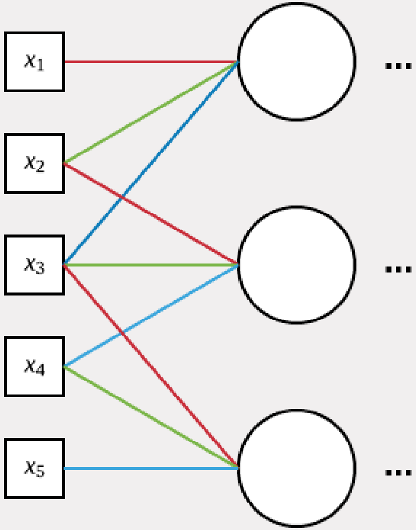
How many weights?



“regular” NN
15 weights

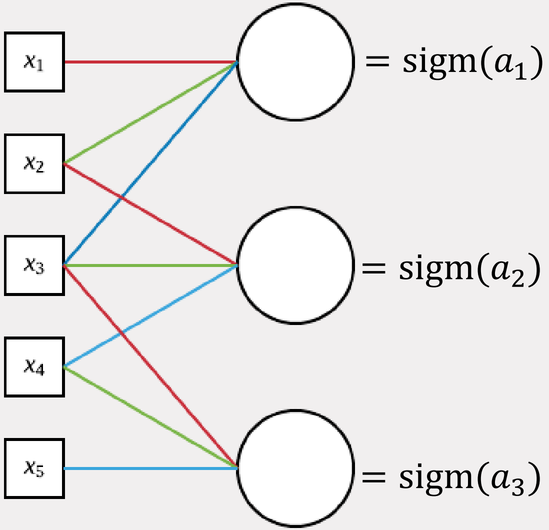


sparsely connected NN
9 weights



shared weights
3 weights

Shared weights



$$a_1 = x_1 w_1 + x_2 w_2 + x_3 w_3$$

$$a_2 = x_2 w_1 + x_3 w_2 + x_4 w_3$$

$$a_3 = x_3 w_1 + x_4 w_2 + x_5 w_3$$

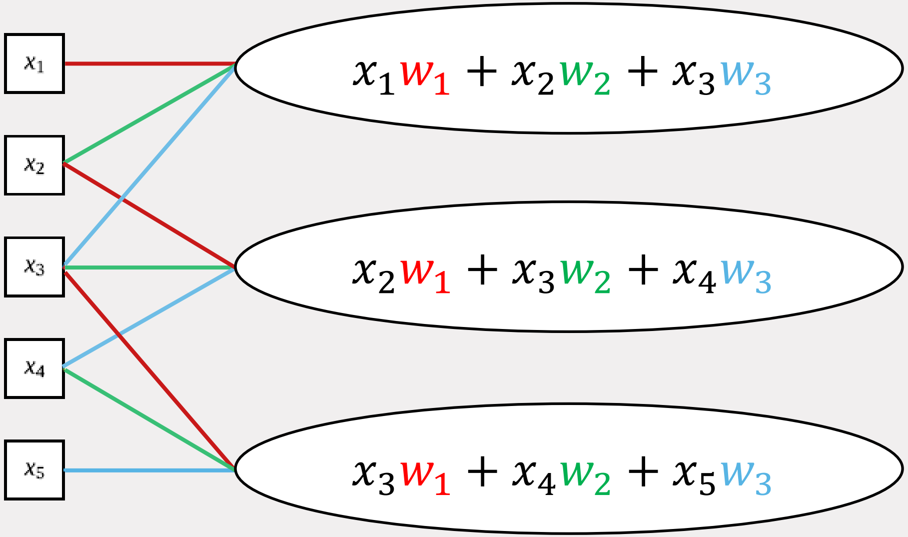
$$[a_1 \quad a_2 \quad a_3] =$$
$$[x_1 \quad x_2 \quad x_3 \quad x_4 \quad x_5] * [w_1 \quad w_2 \quad w_3]$$

shared weights

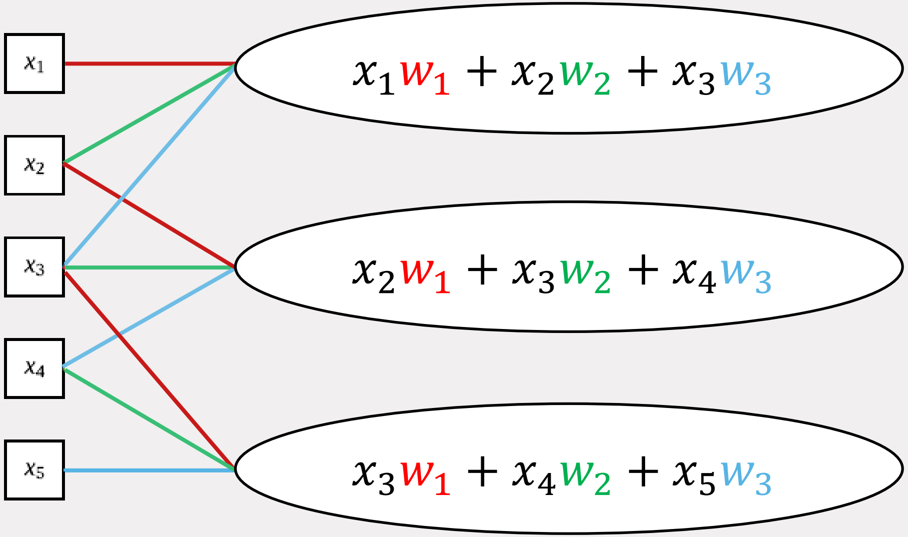
3 weights

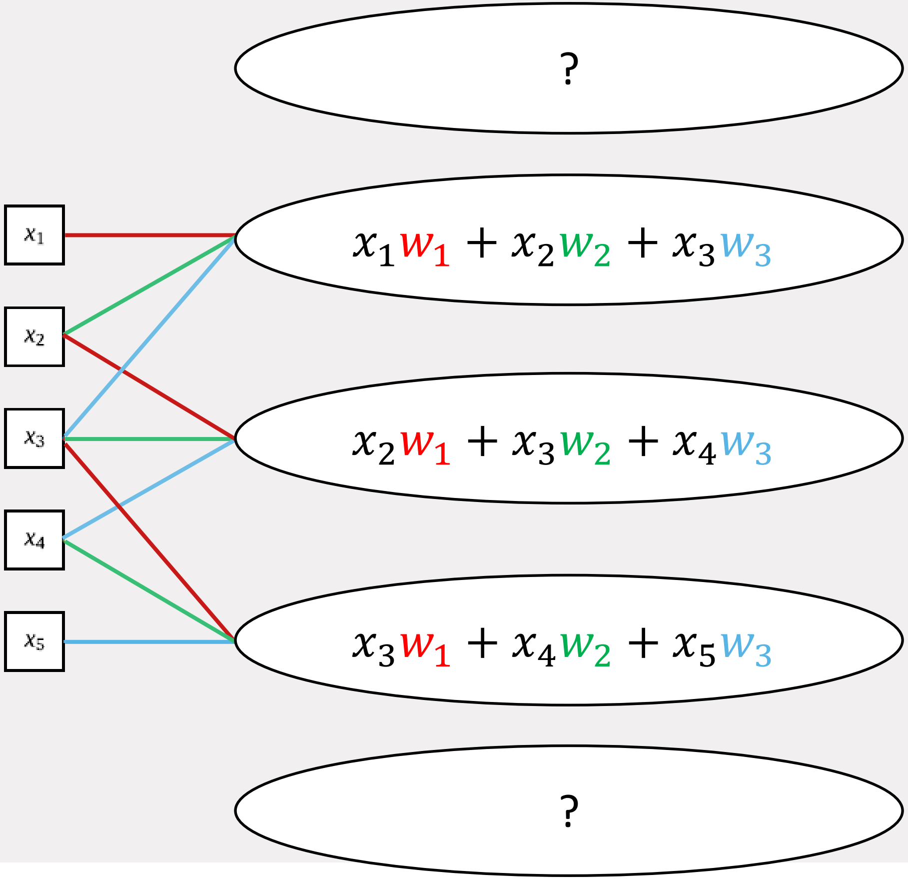
convolution, thus convolutional NN

1-D Convolution



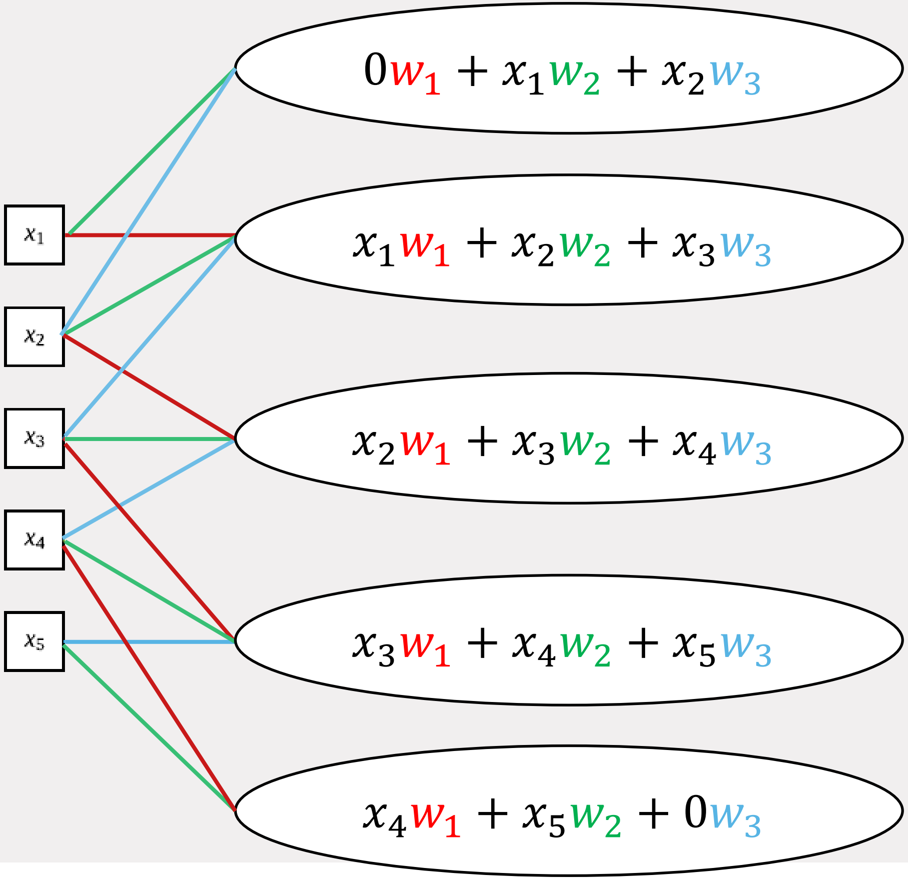
1-D Convolution





1-D Convolution

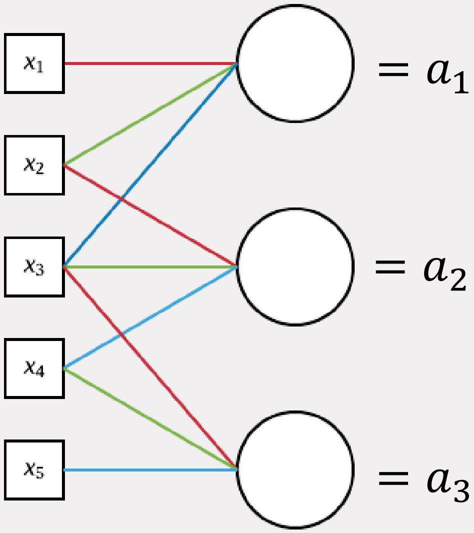
How can we keep the same number of features in hidden layer 1?



1-D Convolution

Zero-padding!

1-D Convolution



$$a_1 = x_1 w_1 + x_2 w_2 + x_3 w_3$$

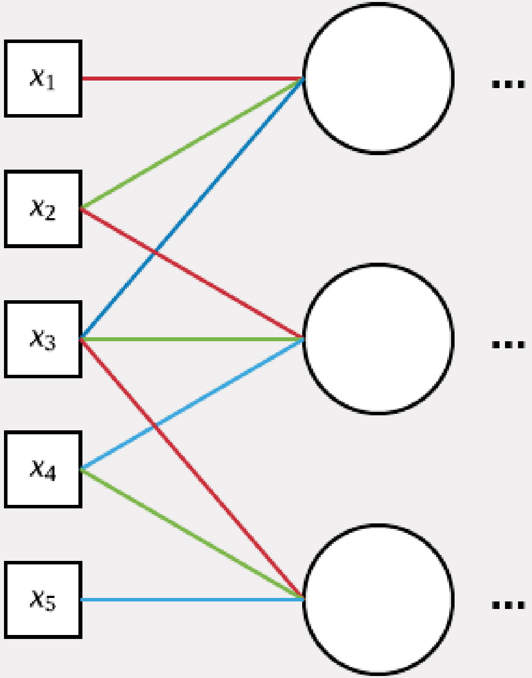
$$a_2 = x_2 w_1 + x_3 w_2 + x_4 w_3$$

$$a_3 = x_3 w_1 + x_4 w_2 + x_5 w_3$$

$$[a_1 \quad a_2 \quad a_3] =$$
$$[x_1 \quad x_2 \quad x_3 \quad x_4 \quad x_5] * [w_1 \quad w_2 \quad w_3]$$

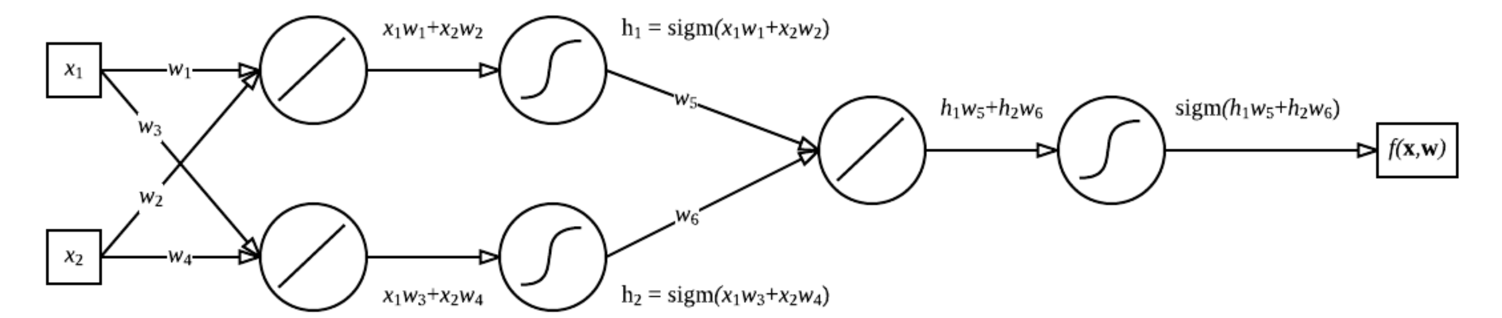
Properties of convolutional neural networks

- Sparse connectivity
- Weight sharing
- Parallel computations



Why does this work?

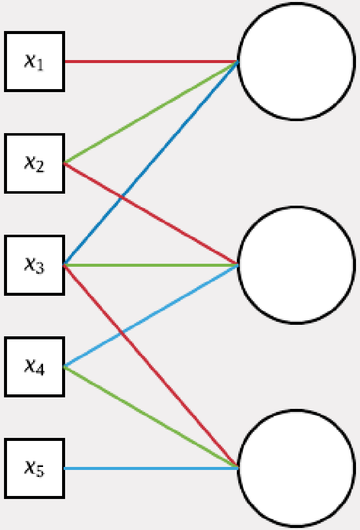
- Multiple layers
- Hidden layers contain features calculated from previous layers



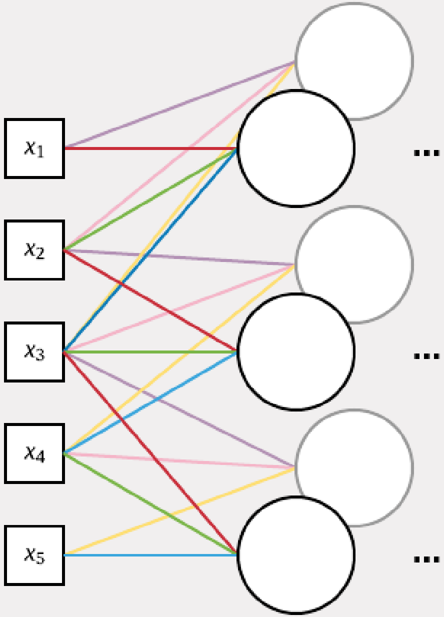
Why does this work?

- Different layers contain different transformation
  - Simple (e.g. edges, colors)
  - Complex (final layers)

One added benefit is that the learned transformations will be equivariant with translation (if the features/image is shifted up/down the features will still be detected).



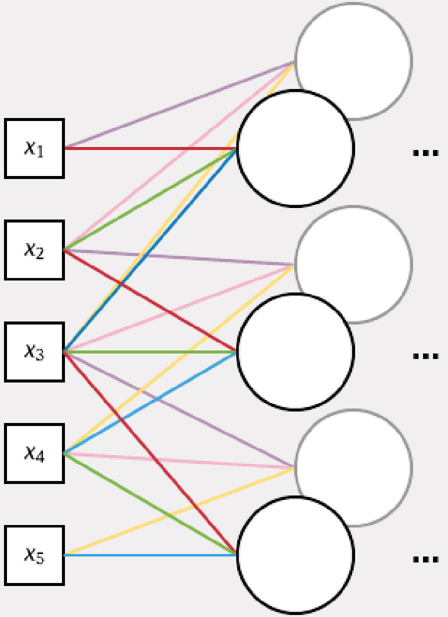
shared weights
3 weights



<u>two sets</u> shared weights
6 weights

We can add additional sets of weights that can learn additional interesting transformation of the input.

Note that the added neurons <u>are not</u> a new layer. They are part of layer 1.



<u>two sets</u> shared weights

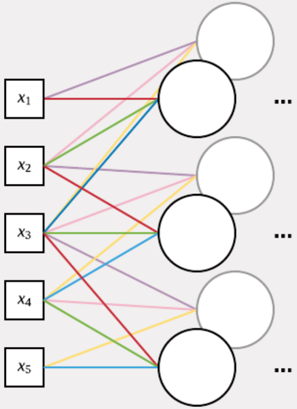
6 weights

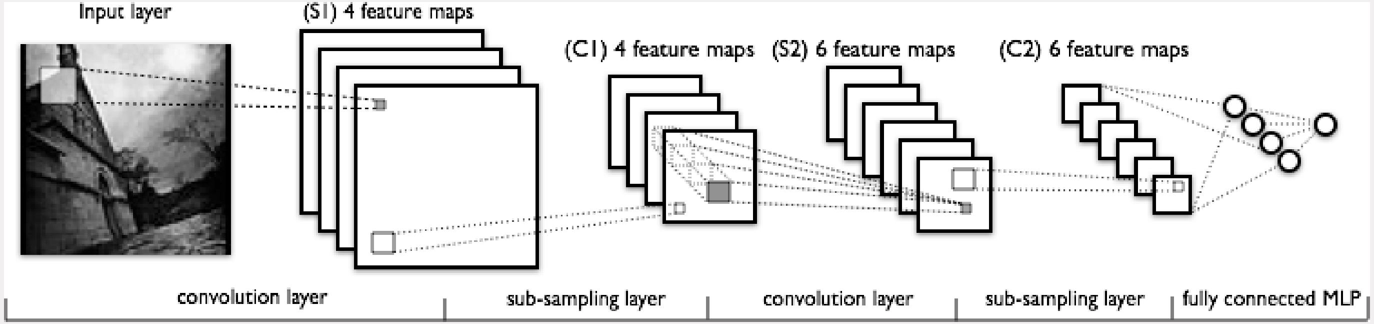
$$[a_{1,1} \quad a_{1,2} \quad a_{1,3}] = [x_1 \quad x_2 \quad x_3 \quad x_4 \quad x_5] * [w_{1,1} \quad w_{1,2} \quad w_{1,3}]$$

$$[a_{2,1} \quad a_{2,2} \quad a_{2,3}] = [x_1 \quad x_2 \quad x_3 \quad x_4 \quad x_5] * [w_{2,1} \quad w_{2,2} \quad w_{2,3}]$$

$[w_{1,1} \quad w_{1,2} \quad w_{1,3}]$, and $[w_{2,1} \quad w_{2,2} \quad w_{2,3}]$ are **convolution kernels**. They extract <u>features</u>. However, they are not hand-designed features – they were <u>learned</u> by the neural network.

Convolutional neural networks are ideal for images





1D NN ⟷ **2D NN (images)**

Because of the weight sharing, convolutional neural networks only work with structured data (such as images) as inputs.

$$\begin{bmatrix} I_1 & I_2 & I_3 & I_4 & I_5 \\ I_6 & I_7 & I_8 & I_9 & I_{10} \\ I_{11} & I_{12} & I_{13} & I_{14} & I_{15} \\ I_{16} & I_{17} & I_{18} & I_{19} & I_{20} \\ I_{21} & I_{22} & I_{23} & I_{24} & I_{25} \end{bmatrix} * \begin{bmatrix} w_1 & w_2 & w_3 \\ w_4 & w_5 & w_6 \\ w_7 & w_8 & w_9 \end{bmatrix} =$$

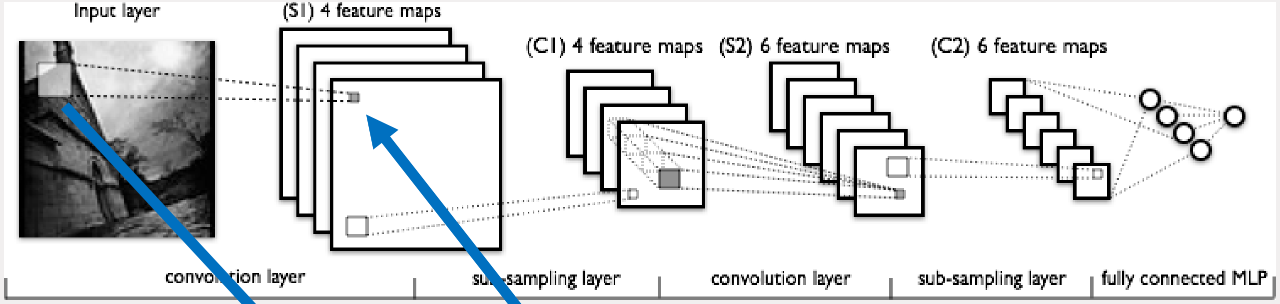
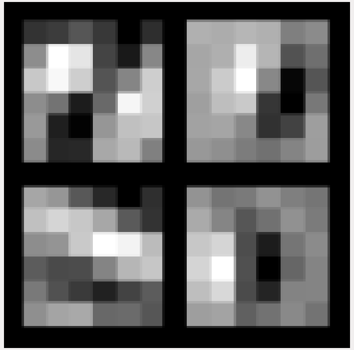
Convolutional kernels



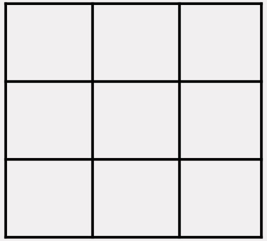


these are the weights (convolutional kernels) that produce the four feature maps

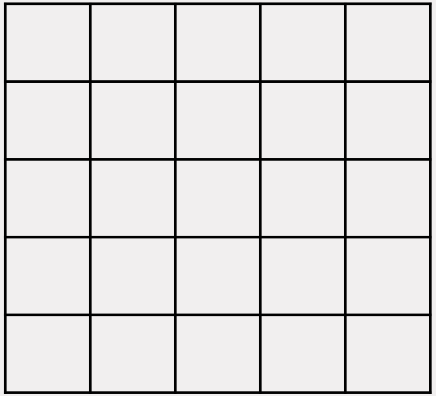
Kernel size

1 x 1

3 x 3

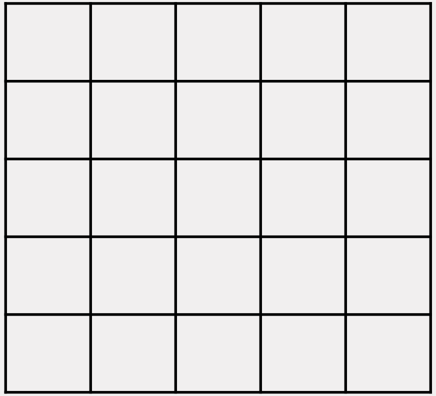


5 x 5



- More weights → more information
- More computations / memory
- Receptive field

Receptive field

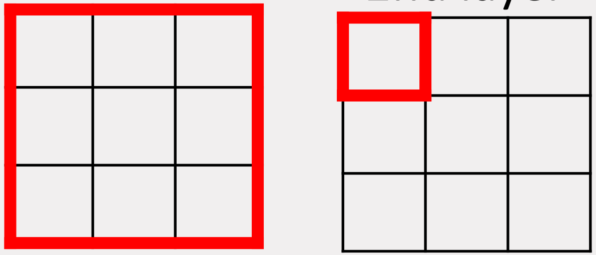


5 x 5

25 weights

Same receptive field

2nd layer



3 x 3

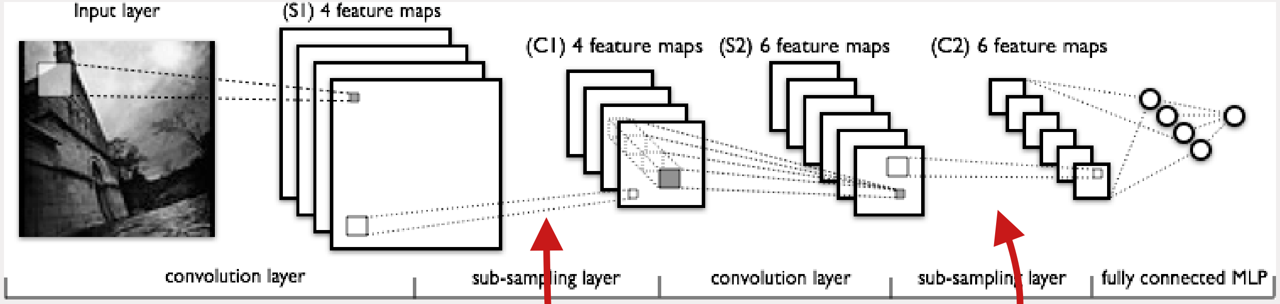
9 weights

3 x 3

9 weights

= 18 weights

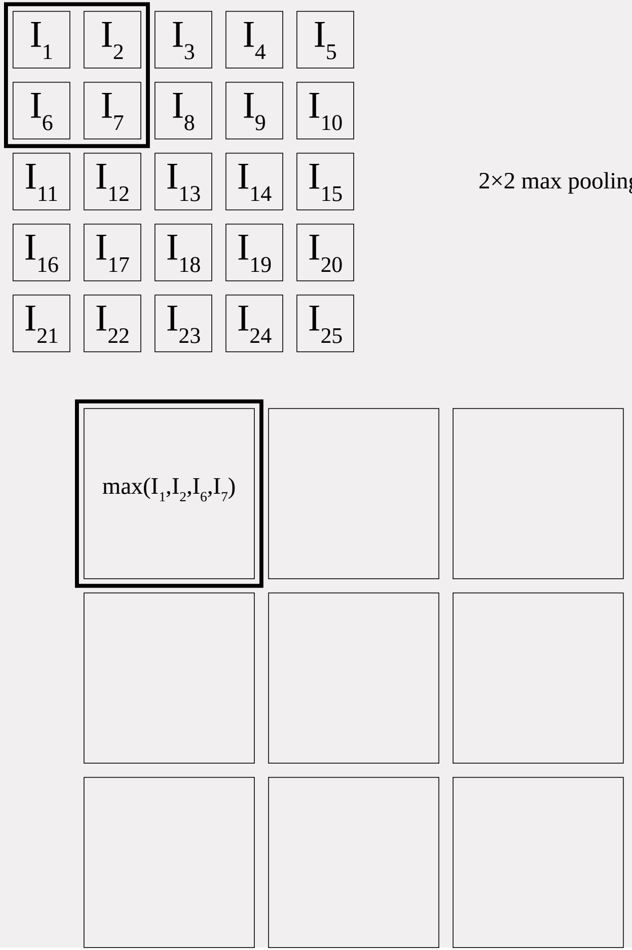
Max-pooling



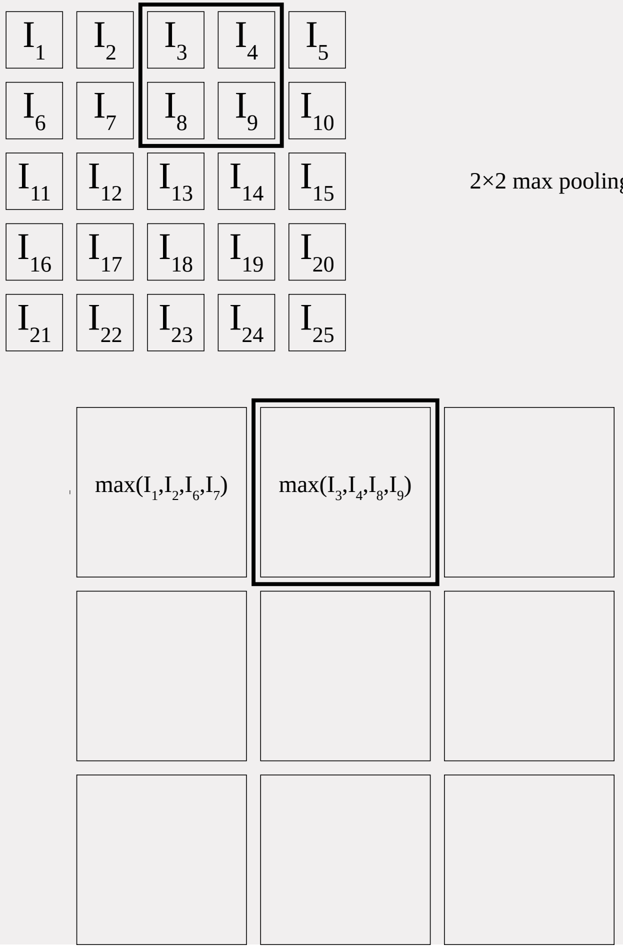
max-pooling

Max-pooling

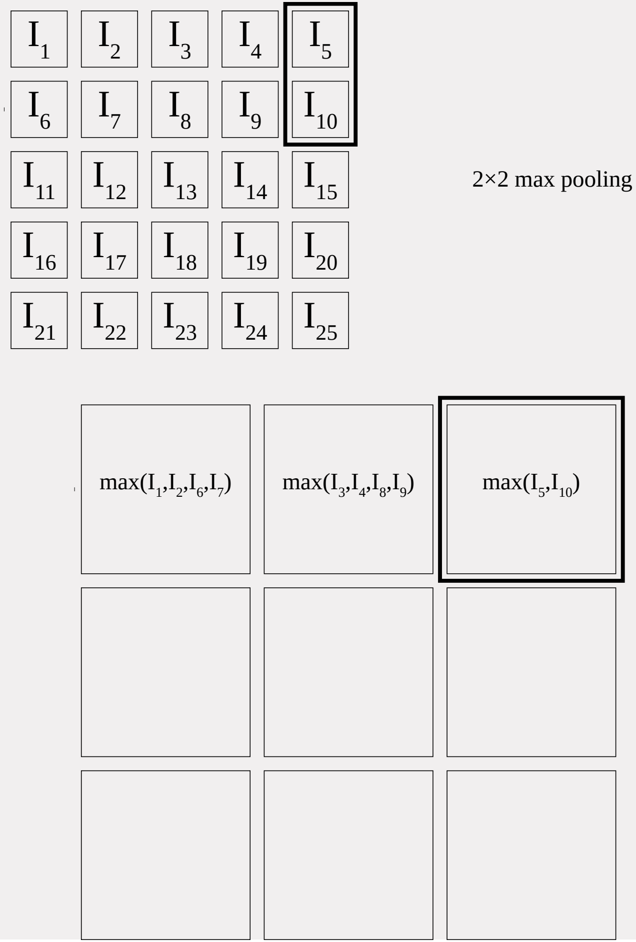
- Reduce size of feature space
- Maximum of features
- Typical kernel size = 2 x 2



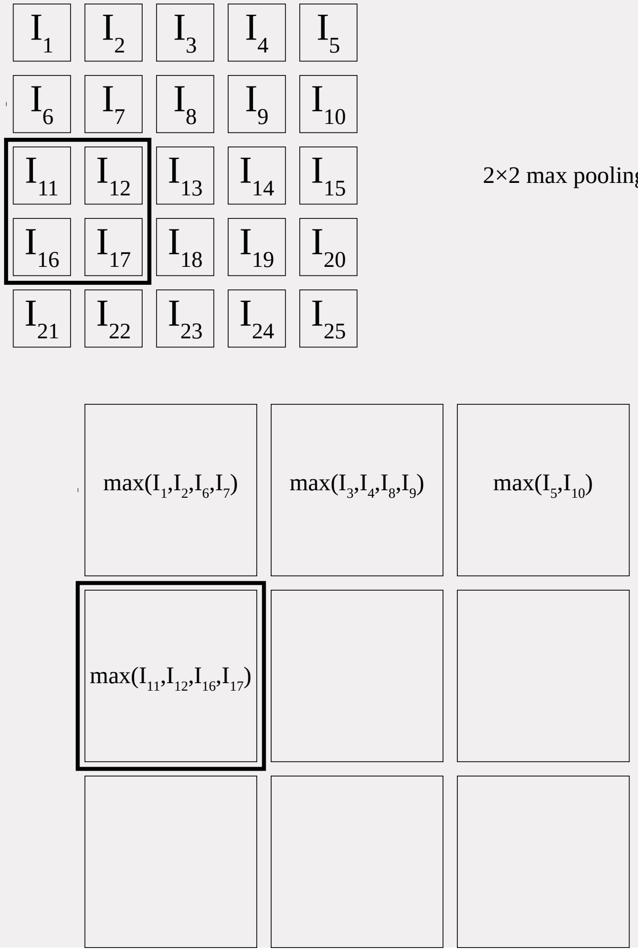
2×2 max pooling



2×2 max pooling



In this example:
no zero padding



2×2 max pooling

I_1	I_2	I_3	I_4	I_5
I_6	I_7	I_8	I_9	I_{10}
I_{11}	I_{12}	I_{13}	I_{14}	I_{15}
I_{16}	I_{17}	I_{18}	I_{19}	I_{20}
I_{21}	I_{22}	I_{23}	I_{24}	I_{25}

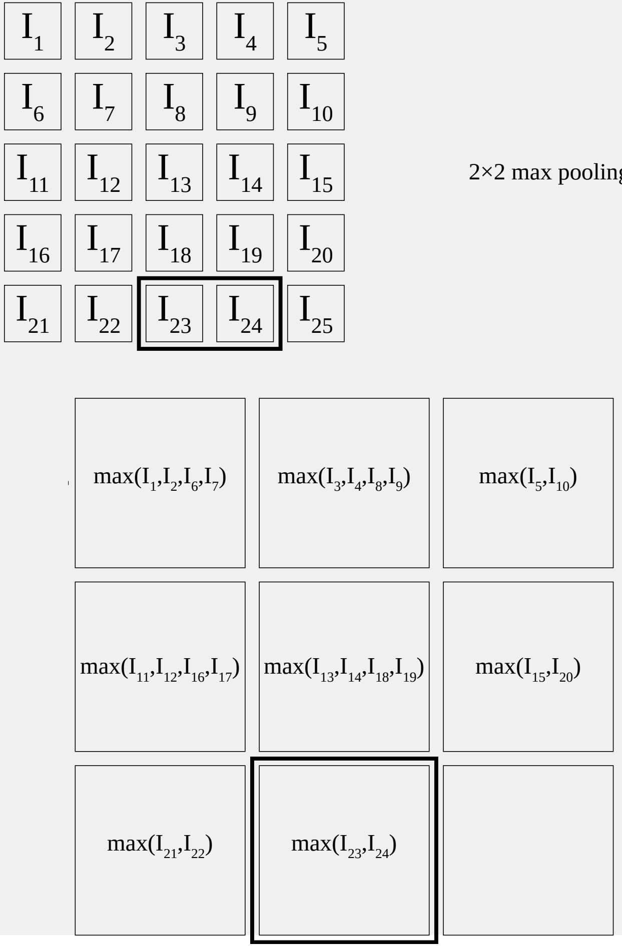
2×2 max pooling

$\max(I_1,I_2,I_6,I_7)$	$\max(I_3,I_4,I_8,I_9)$	$\max(I_5,I_{10})$
$\max(I_{11},I_{12},I_{16},I_{17})$	$\max(I_{13},I_{14},I_{18},I_{19})$	

I_1	I_2	I_3	I_4	I_5
I_6	I_7	I_8	I_9	I_{10}
I_{11}	I_{12}	I_{13}	I_{14}	I_{15}
I_{16}	I_{17}	I_{18}	I_{19}	I_{20}
I_{21}	I_{22}	I_{23}	I_{24}	I_{25}

2×2 max pooling

$\max(I_1,I_2,I_6,I_7)$	$\max(I_3,I_4,I_8,I_9)$	$\max(I_5,I_{10})$
$\max(I_{11},I_{12},I_{16},I_{17})$	$\max(I_{13},I_{14},I_{18},I_{19})$	$\max(I_{15},I_{20})$
$\max(I_{21},I_{22})$		



2×2 max pooling

I_1	I_2	I_3	I_4	I_5
I_6	I_7	I_8	I_9	I_{10}
I_{11}	I_{12}	I_{13}	I_{14}	I_{15}
I_{16}	I_{17}	I_{18}	I_{19}	I_{20}
I_{21}	I_{22}	I_{23}	I_{24}	$\boxed{I_{25}}$

2×2 max pooling

$\max(I_1,I_2,I_6,I_7)$	$\max(I_3,I_4,I_8,I_9)$	$\max(I_5,I_{10})$
$\max(I_{11},I_{12},I_{16},I_{17})$	$\max(I_{13},I_{14},I_{18},I_{19})$	$\max(I_{15},I_{20})$
$\max(I_{21},I_{22})$	$\max(I_{23},I_{24})$	$\boxed{I_{25}}$

Benefits of max-pooling

- “Quickly” reduces the number size of the feature maps
- Introduces translation invariance (slightly translated version of the input image will result in the same output)

Alternative: Average Pooling

Let try it out!

aharley@scs.ryerson.ca

Training of Convolutional Neural Networks

- Similar to training of ‘fully connected’ neural networks
- Optimize networks weights with respect to a loss function that describes difference between network output and label/annotation
- Update networks weights iteratively
- Keep track of model performance on train & validation set

Summary

- Concept of **convolutions** in a neural network
- Why can we use a **convolutional approach** for (medical) **images**
- Convolutions enable development of **deep** (and large) **neural networks**
- **Max-pooling layer** in a convolutional neural network
- **Kernel size**
- **Receptive field**
